

Ai critics

While AI does give proper result, it give it in a way that is comply to only what have been given to. Specifically most of given testcase are the thing given in prompt, such as branding, form layout, ... This also require alot of time to think how the model would response and alot of context about the goal to do a thing that would had learn in class if not for AI requirements and AI taking over classroom.

It also does not follow instruction well as, even with explicited instruction to not add "Test...", it still add it. This suggest that this is at best a prediction tool to aid work, not to replace work. This also a weak example to always check AI output and understand that it can mess up / does not replace people with skill that could have been taught in class.
